

Sales Performance & Regional Profitability Analysis

1. Executive Summary

This project analyses sales performance, customer growth, and regional profitability using Microsoft Excel.

The analysis covers sales activity from January to September 2023 across seven regions and combines raw sales data, Pivot Table analysis, and dashboard visualisations to provide a consolidated view of business performance.

The analysis recorded total sales of 754,940.70, total profit of 891,111, and 9,360 customers during the period.

Overall performance strengthened considerably during the second half of the period, with sales reaching a peak of 130,000 in August and customer volume reaching 2,000 in September.

2. Business Objective

The purpose of the analysis was to transform the underlying sales data into a management-friendly dashboard that could be used to monitor:

- Monthly sales performance
- Sales versus recorded targets
- Customer growth
- Regional profitability
- Performance completion indicators

The dashboard was designed to make key trends easier to identify without requiring users to manually analyse the underlying dataset.

3. Data & Methodology

The dataset contains monthly sales activity across seven regions from January through September 2023.

The analysis included:

- Data organization and preparation
- Pivot Table aggregation
- Monthly sales analysis
- Customer trend analysis
- Regional profit analysis

- KPI visualization
- Dashboard development

Excel Pivot Tables were used to summarize the underlying data before creating the dashboard visualizations.

4. Key Findings

Sales Performance

Total recorded sales were 754,940.70.

Sales increased from 30,000 in January to 130,000 in August, making August the strongest sales month.

July also recorded strong performance at 129,940.70, followed by September at 125,000.

January recorded the lowest monthly sales at 30,000.

Customer Growth

The analysis recorded 9,360 customers across the period.

Customer volume increased from 300 in January to 2,000 in September, representing approximately a 567% increase from the beginning to the end of the period.

The strongest customer volume was recorded in September.

Regional Profitability

Total recorded profit was 891,111.

Brazil recorded the highest regional profit at 129,875, followed by Chile at 128,833 and Peru at 127,340.

Regional profitability was relatively balanced. The difference between the highest and lowest regional profit was only 3,895.

5. Business Insights

The analysis highlights three major trends.

First, sales performance strengthened considerably during the second half of the period, with monthly sales exceeding 100,000 from June onward.

Second, customer activity increased substantially over the same period, reaching its highest level in September.

Third, profitability was relatively evenly distributed across the regions, suggesting that performance was not dependent on a single region.

An additional point requiring validation is the recorded target data. The dataset contains total sales of 754,940.70 against recorded target sales of 118,000. Before these figures are used for formal target-achievement reporting, the target methodology should be reviewed to confirm that the two measures are directly comparable.

6. Recommendations

Based on the findings, the following actions could be considered:

1. Investigate the factors responsible for the strong increase in sales during the second half of the period.
2. Analyse the customer acquisition and retention activities associated with the increase in customer volume.
3. Review the practices contributing to Brazil's leading regional profitability.
4. Monitor regional performance regularly to identify emerging changes in profitability.
5. Validate the target-setting methodology before using sales-versus-target figures for formal performance evaluation.

7. Tools & Skills

Tools

- Microsoft Excel
- Pivot Tables
- Excel Charts

Skills

- Data preparation
- Data analysis
- KPI analysis
- Trend analysis
- Sales analysis
- Customer analysis
- Regional profitability analysis
- Data visualization
- Dashboard development
- Business reporting

8. Conclusion

The analysis demonstrates how Excel can be used to transform structured business data into a visual management dashboard.

The resulting dashboard provides a consolidated view of sales, customer activity, and regional profitability while highlighting important trends that can support further business investigation and decision-making.
